LETTER OF APPROVAL

This is to certify that this project prepared by **CHITRA PRASAD ACHARYA** entitled “**EXAM SEAT MANAGEMENT SYSTEM USING ZIGZAG ALGORITHM**” in partial fulfillment of the requirements for the degree of Bachelor's in Computer Application has been evaluated. In our opinion it is satisfactory in the scope and quality as a project for the required degree.

Abstract

In educational institutions, managing exam seating manually can be time consuming, error-prone and inefficient. The “Exam Seat Management System” is a web application provides a smart solution to this challenges by automating the entire exam hall allocation process. This system allows administrators to enter classroom layouts, assign students to seats using optimized algorithms (like zigzag distribution), and manage special accommodations for students with specific needs. It ensures fairness, prevents unfair groupings, and maximizes space utilization across all available rooms. By eliminating manual processes and introducing a user-friendly interface, the system enhances efficiency, accuracy, and transparency in exam management. The platform is especially useful during peak exam seasons, enabling institutions to organize and monitor student seating with ease and precision, thereby reducing administrative burden and improving overall exam discipline and experience.

Keywords: *Web application, Zigzag Algorithm, Angular, Spring Boot, Seat Allocation, PostgreSQL, Cross-platform.*

Acknowledgements

I would like to express my sincere gratitude to everyone who contributed to the development of the "Exam Seat Management System" project. First and foremost, we would like to thank our project supervisor, **Er. Supervisor Name** Sir for his invaluable guidance, support, and encouragement throughout this project. His expertise and insights were instrumental in shaping the direction and scope of this project.

Additionally, we extend our appreciation to our Coordinator **Er. Coordinator Name** Sir for providing the resources and support necessary to complete this project. The access to facilities and technology greatly facilitated our work.

Finally, we are thankful to our families and friends for their unwavering support and encouragement throughout this journey. Their belief in our abilities kept us motivated and focused.

This project would not have been possible without the contributions of all these individuals and organizations. Thank you for your support.

Sincerely,

Chitra Prasad Acharya (10xxxxxxx)

Chapter 1: Introduction

1.1 Introduction

This proposal outlines the development of an Exam Seat Arrangement System for college, designed to efficiently allocate exam seats to students based on symbol numbers provided by College or University. The system will handle multiple classrooms with varying bench configurations and provide students with easy access to their seating information through a simple web interface integrated with the college's landing page.

1.2 Problem Statement

- Manual allocation of seats is time-consuming and error-prone.
- Classrooms have varying layouts and bench configurations.
- Students struggle to find their assigned seats on exam day.
- Last-minute changes are difficult to accommodate.

1.3 Objectives

The main objectives of this project can be enumerated as follows:

- To increase efficiency and reduce errors by eliminating the need for manual calculations and adjustments in the seating arrangement process.
- To develop system to assign exam seats based on students' symbol numbers.
- To provide students with quick and easy.

1.4 Scope and Limitation

1.4.1 Scope

- Development of a web-based exam seating arrangement system
- Automatically assigns seats to students across multiple classrooms
- Supports different bench configurations and layouts
- Students can check their assigned seats by entering their symbol number

1.4.2 Limitations

- Admin-only web application for report generation
- Built for single-college use

1.5 Development Methodology

For the methodology of the proposed system, I am using the waterfall methodology.

The Waterfall methodology is a traditional, linear approach to software development where the process flows sequentially through distinct phases: requirements gathering, system design, implementation, testing, deployment, and maintenance. Each phase must be completed before moving to the next, and changes are difficult to incorporate once a stage is finalized. It's best suited for projects with clearly defined requirements and minimal expected changes. While it's simple and structured, its rigidity makes it less effective for complex or evolving projects compared to more flexible models like Agile.

Figure 1. 1 Waterfall Model

1.6 Report Organization

Chapter 1: Introduction

This chapter presents an overview of the Exam Seat Management System project, outlining its importance in the context of academic planning and seat management. It defines the problems being addressed and explains the motivation behind the project. The chapter also clearly states the objectives, scope and limitations of the system, providing a structured understanding of what the project intends to achieve. Finally, it concludes with a brief summary of the report structure.

Chapter 2: Background Study and Literature Review

The second chapter includes background study i.e., description of fundamental theories, general concepts and terminology related to the project. It also includes the literature review i.e., review of the similar projects, research and theories done by other researchers.

Chapter 3: System Analysis and Design

This chapter discusses the system requirements, both functional and non-functional, supported by use case diagrams to depict user interactions. It also includes data modeling through Entity Relationship (ER) diagrams and process modeling using Data Flow Diagrams (DFDs). The design section elaborates on the system architecture, interface design, database schema, and navigation flow, ensuring a clear understanding of how the system is structured.

Chapter 4: Implementation and Testing

This chapter covers the practical implementation of the Exam Seat Management System using Angular for the frontend, Spring Boot for the backend, and PostgreSQL as the database. It describes the development of key modules including Classroom creation, Student seat allocation. The chapter also details the testing processes applied, including unit testing, integration testing, and system testing, to ensure reliability and accuracy.

Chapter 5: Conclusion and Future Recommendations

The final chapter summarizes the project outcomes, lessons learned, and suggestions for future enhancement.

Chapter 2: Background Study and Literature Review

2.1 Background Study

The “Exam Seat Management System” is a web-based application designed to estimate the process of allocating seats during examinations in educational institutions. Traditionally, this task has been carried out manually, which often leads to errors, inefficiencies, and poor utilization of space and resources. Proper seat management involves identifying available rooms, assigning students to seat based on capacity and regulations, and ensuring a smooth and fair arrangements. By digitizing the process, the system aims to reduce human error, save administrative time, and improve the overall organization of examinations. The application collects relevant student and room data, processes this information using predefined rules, and generates optimized seating plans. This not only helps examination coordinators manage logistics more effectively but also enhances transparency and reduces last-minute confusion. Overall, the system contributes to a more efficient and organized examination environment.

2.2 Literature Review

For this project, the team conducted extensive research and reviewed various websites, articles, documentation and applications. Through this research, it was discovered that numerous web-based systems and tools are available, focusing on exam seat management, student performance tracking, and overall school management. Below are some of the relevant systems and platforms that were studied:

Theory Exam Seat Management System

It is a web-based system developed by faculty and students designed to automate the process of exam hall allotment. Students can check their exam hall details by entering their symbol number, reducing confusion and manual workload. The system enables staff to manage the entire examination process, including attendance tracking and student identity verification. It simplifies the complete workflow from exam creation to seating assignment, making the examination process more efficient and organized for both students and administrative staff [1].

Chapter 3: System Analysis and Design

3.1 System Analysis

This chapter discusses about the proposed model of the system, the methodology used in building the system, tools and techniques, requirement analysis, requirement specification. It also talks about the functional requirements of the system, the system design. The application architecture of the system will also be shown in this chapter, the use case diagram, data design, activity diagrams, dataflow diagram, control flow diagram, entity-relationship diagram (ERD) and user interface design will all be shown in this chapter.

3.1.1 Requirement Analysis

The following section presents the complete set of functional requirements of Exam Seat Management system.

i. Functional Requirements

Following figure shows the requirements of Exam Seat Management system:

Figure 3. 1 Use Case Diagram of Exam Seat Management

Use Case Description:

Table 3. 1 Use case Scenario for Login

Use-Case Identifier	UC1: Login
Primary Actor	Admin
Secondary Actor	X
Description	Admin login with valid credentials to access the system.
Pre-Condition	Admin account must exist with valid credentials.
Success Scenario	Admin is logged in successfully.
Failure Scenario	Login fails due to invalid username/password.

Table 3. 2 Use Case Scenario for Manage Classroom

Use-Case Identifier	UC2: Manage Classroom
Primary Actor	Admin
Secondary Actor	X
Description	Admin manages the classroom with the required data.
Pre-Condition	Admin must be logged in.
Success Scenario	Classroom created successfully.
Failure Scenario	Error message is shown if any field is wrong or empty.

Table 3. 3 Use Case scenario for Student Seat Allocation.

Use-Case Identifier	UC3: Student Seat allocation
Primary Actor	Admin
Secondary Actor	X
Description	Admin manages the student's seat for the exam.
Pre-Condition	Admin must be logged in.
Success Scenario	Seat allocated successfully.
Failure Scenario	Operation fails due to invalid input or system error.

Table 3. 4 Use Case Scenario for Student Search Exam Seat

Use-Case Identifier	UC4: Student search exam seat
Primary Actor	User
Secondary Actor	X
Description	Student search there exam seat place.
Pre-Condition	There details should be inserted by Admin.
Success Scenario	Exam Seat fetched and displayed successfully.
Failure Scenario	Student with symbol number not found.

Table 3. 5 Use Case Scenario for Change Password

Use-Case Identifier	UC5: Change Password
Primary Actor	Admin
Secondary Actor	X
Description	Admin can change the password from old to new one.
Pre-Condition	They must be logged-in.
Success Scenario	Password Changed successfully.
Failure Scenario	If the password that need to be changed does not matched.

ii. Non Functional Requirements

1. Performance Requirement

- Fast API response for file compression and data updates.

2. Accessibility

- The system is web-based and accessible via standard web browsers such as chrome, Firefox, Microsoft etc.
- User should not require additional plugins or installations to access the system.

3. Security

- Secure login should be enforced for all registered users, using industry-standard authentication protocols.
- Sensitive user data, including email, symbol number, and other details, must be securely encrypted both in transit (HTTPS) and at rest.

3.1.2 Feasibility Analysis

Some important feasibility studies are mentioned below:

i. Technical Feasibility

It is technically feasible as I already have hardware and software required for development of a software. Also, I have technical knowledge on how the project is made through programming language like JavaScript (JS), TypeScript (TS), Java, etc.

ii. Operational Feasibility

It is operationally feasible as I am making this system by removing the threats and weakness of existing non manageable system which is reliable for the users.

iii. Economic Feasibility

The system does not require extra software and hardware. So, there is no recurring cost than just the internet connection.

iv. Schedule Feasibility

The project is achievable within a 3–4 month timeline using a standard development model like Agile or Waterfall. Tasks can be divided efficiently across planning, development, and testing phases.

Task	Day Needed	Start Date	End Date
Request Analysis	10	2/23/2025	3/5/2025
System Design	14	3/6/2025	3/20/2025
Implementation	70	3/21/2025	5/30/2025
Testing	8	5/31/2025	6/8/2025
Deployment	8	6/9/2025	6/17/2025
Maintenance	5	6/18/2025	6/23/2025
Documentation	120	2/23/2025	6/23/2025

Figure 3. 2 Exam Seat Management Gnatt Chart

3.1.3 Data Modeling (ER-Diagram)

The ER Diagram of Exam Seat Management System is shown below;

Figure 3. 3 Entity Relationship for Exam Seat Management System

3.1.4 Process Modeling (DFD)

The Level 0 and Level 1 Data flow diagram of the Exam Seat Management System are below:

Figure 3. 4 Level 0 DFD of Exam Seat management System

Figure 3. 5 Level 1 DFD of Exam Seat management System

3.2 System Design

3.2.1 Architecture Design

Figure 3. 6 Architecture Design of Exam Seat Management System

3.2.2 Database Schema Design

Figure 3. 7 Database Schema Diagram of Exam Seat Management System

3.3 Algorithm Details

Zigzag Algorithm used for distributing students across classroom seats in an efficient, fair, and organized way. It ensures special accommodations, maximizes space utilization, and avoids clustering of similar students.

The Zigzag Seat Allocation Algorithm mainly performs the following tasks:

- Distributes students' row-by-row and column-by-column in a zigzag pattern to avoid unfair grouping.
- Reserves front seats for special needs students and optimizes seat usage.

The working of the ZigZag algorithm is explained in the below steps:

Step-1: Collect student and classroom data.

Step-2: Separate special needs students and reserve front seats for them.

Step-4: Allocate regular students using zigzag pattern (left-to-right, then right-to-left).

Step-5: Move to next room if current room is full.

Step-6: Map each student to room, bench, side, and row.

Step-7: Seat allocation is complete.

Pseudo code of Zigzag Algorithm

FUNCTION zigzagSeatAllocation(studentList, totalRows, totalCols):

```
// Step 1: Initialize seat matrix
seats = 2D array of size totalRows × totalCols
index = 0 // Pointer for current student

// Step 2: Loop through each row
FOR row FROM 0 TO totalRows-1:
    IF row is even:
        // Fill left to right
        FOR col FROM 0 TO totalCols-1:
            IF index < length(studentList):
                seats[row][col] = studentList[index]
                index = index + 1
            ELSE:
                seats[row][col] = EMPTY
    ELSE:
        // Fill right to left
        FOR col FROM totalCols-1 DOWNT0 0:
```

```
IF index < length(studentList):  
    seats[row][col] = studentList[index]  
    index = index + 1  
ELSE:  
    seats[row][col] = EMPTY  
RETURN seats
```

Chapter 4: Implementation and Testing

4.1 Implementation

During the implementation phase of the Exam Seat management System, the following tools and technologies were utilized to develop the project and prepare documentation.

4.1.1 Tools Used

Category	Tools and Description
CASE Tools	Draw.io for creating diagrams (Waterfall Model, ER, DFDs and so on)
Frontend	Angular for SPA development, Bootstrap for responsive UI.
Backend	Spring Boot for RESTful APIs and business logic, PostgreSQL for data persistence.
Testing	JUnit for unit testing, Postman for API testing.
Development Environment	IntelliJ IDEA and Visual Studio for coding, Git for version control.

4.2 Testing

4.2.1 Test Cases for Unit Testing

Table 4. 1 Test Case for Admin

S.N	Test Case	Test Input	Expected Result	Outcome	Result
1	Login with valid credentials	User name: Admin Email: admin@exam.com Password: exam@123	Toast Message with Login successfully and redirect to dashboard.	As expected	PASS

2	Classroom creation with bench configuration	Classroom forms with field such as room number, building, floor, bench configuration with rows and columns, capacity etc	Toast message display "Classroom created successfully"	As expected	PASS
3	Seat allocation for student	File: Csv file with student data Exam Date: 2026-01-05	Seating arrangement successful for date (value) message shown.	As expected	PASS
4	Login with invalid credentials	Email: ram Password: ram@123	Toast error message pops up saying "Invalid username or password".	As expected	PASS

Table 4. 2 Test Case for Student

S.N	Test Case	Test Input	Expected Result	Outcome	Result
1	When student search for seat number using roll number and date.	Roll number: BCA2078013 Exam date: 2026-01-05	Student Seat detail is displayed in the Classroom Layout	As expected	PASS

4.2.2 Test Cases for System Testing

System testing evaluated the Exam Seat Management System as a complete application to ensure it met its objectives as a reliable seat allocation solution. Tests confirmed that admins could create classrooms with benches and capacity, insert student data, and allocate seats using the Zigzag algorithm without errors, ensuring fair and efficient distribution. The system's responsiveness was verified across devices (desktop, tablet, mobile), ensuring a user-friendly interface and seamless navigation. Student features, such as searching by roll number to retrieve seat details, were tested to confirm accurate and quick results. Admin functionalities were validated by ensuring classroom setups and student data insertions were reflected correctly in allocations, and actions like updating capacities were applied effectively. Stress testing with 100 concurrent seat searches and allocations confirmed system reliability under load. These tests ensured the application functioned as a robust, user-friendly solution for exam seat management.

Chapter 5: Conclusion and Future Recommendations

5.1 Lesson Learnt/ Outcome

Through the development and implementation of the Exam Seat Management System, I gained a deep understanding of the Zigzag algorithm and its application in efficiently allocating seats in a classroom setting. The system enables administrators to create classrooms with specified benches and capacities, insert student data, and allocate seats using the Zigzag algorithm, ensuring fair and optimized distribution. Students can access their allocated seat numbers by searching with their roll numbers, providing a seamless and accessible experience. The project successfully demonstrated the practical application of algorithmic seat allocation, enhancing my skills in system design, algorithm implementation, and user interface development for educational purposes.

5.2 Conclusion

The Exam Seat Management System stands out as an intuitive solution for automating seat allocation in examination settings using the Zigzag algorithm. The system's capability to fairly distribute students across classroom benches optimizes space utilization and ensures an organized exam process. Administrators can create classrooms, define bench capacities, and input student data, with the Zigzag algorithm efficiently assigning seats. Students benefit from a user-friendly interface that allows them to search for their seat numbers by roll number, with results displayed promptly. The system's responsiveness across devices (desktop, tablet, mobile) ensures accessibility, while admin functionalities, such as updating classroom setups and monitoring allocations, enhance operational efficiency. System testing confirmed reliable performance under load, with 100 concurrent seat searches and allocations processed without errors. This project demonstrates the practical utility of the Zigzag algorithm in streamlining exam logistics, offering both administrative efficiency and educational value in understanding algorithmic solutions.

5.3 Future Recommendation

In near future we are going to implement the following criteria:

- User Activity Logs and History Tracking
- Mobile Application Support

Important Information for Students

- Arrive at least 30 minutes before the exam start time.
- Bring your valid student ID and exam admission card.
- Electronic devices, including mobile phones, are strictly prohibited.
- Only bring permitted materials (pens, pencils, erasers, etc.).
- Follow the invigilator's instructions at all times.
- Verify your exam date and roll number before searching.
- Contact the examination office for any discrepancies in seating details.
